

Meeting Summary

Training/Demo Session — Title Registration & Inventory Walkthrough

Attendees

Ian Velasquez (presenter), Alok Balda, Vijaya Krishna Bandi, Donald Baer, Raghavendra Aerpula, Sarita Tadikamalla, Tirupalu Rapuru

Context

This was a follow-up session continuing from a prior Friday meeting, which had already covered the main menu items and title registration end-to-end. Today's session was planned to cover secondary transactions/registration and other side-menu items, including a title registration transaction involving inventory.

Note on the Demo

Ian was unable to live-demo the inventory-based registration transaction because the DMV-side contact who fulfills test inventory was out of office. He instead talked through the process conceptually using the existing screens.

Key Topics Covered

1. Plate Assignment from Inventory

- When a plate type is stocked in the dealership's inventory (e.g., a standard passenger plate), the system automatically assigns the next plate from a sequential serial number range, rather than manual entry.
- The inventory screen keeps a running historical view: total plates received, number already issued, and number remaining. Example shown: a batch of 50 plates had 32 issued and 18 remaining.
- This historical tracking supports state-mandated reporting requirements later on.

2. Reserved vs. Issued Status

- Reserved: the system places a temporary hold on a plate once it's attached to an in-progress transaction, before that transaction is completed.
- Issued: the transaction has been fully completed and the plate is confirmed assigned.
- This reservation mechanism prevents multiple dealership users processing transactions simultaneously from being assigned the same plate number.

3. Inventory Status Lifecycle

- Sarita Tadikamalla noted that each product has its own set of inventory status stages, similar to how a deal moves through statuses: incomplete → pending → completed → finalized.
- It's important to learn the specific inventory status stages for each state and product.

4. Inventory List Retention / Purge Settings

- A plate range remains visible in the list as long as any plates in it are still available/eligible to issue.
- Once an entire range has been fully issued, it is kept visible for one year by default.
- In the Delphi product, this retention window is customizable — e.g., a user could configure it to drop off the list after 120 days instead of a year.

Other Notes

Early in the call, Donald Baer flagged a screen-share visibility issue, which was resolved before the walkthrough continued.
