

Meeting Summary

CVR PA Connect — Product Demo & Architecture Walkthrough

Attendees

Shaikh Vakeel Shakheer (Lead Developer, presenter), Loknadh Reddy (Product QA), Sarita Tadikamalla, Tadela Vijayabhaskar, Periasamy Leena, Alok Balda (recording)

Agenda

- Understand what CVR PA Connect is
- Review the technology stack and project architecture
- Cover CI/CD and NuGet package management
- Product walkthrough

What is CVR PA Connect

CVR PA Connect provides secure electronic titling and registration solutions for vehicle dealers. It is a web-based application built on a client-server architecture, handling transactions, inquiries, dealer/DMV reports, report generation, and imports from the DMS. It is the modernized version of the earlier Delphi-based product (for Pennsylvania).

Technology Stack

- Front-end: Angular 16
- Back-end: .NET 6 APIs
- Scheduled jobs: Hangfire (within .NET)

Backend / Host Architecture

- Every transaction flows through two back-end systems: after the current host processes it, it's routed to a separate .NET service called Gatekeeper, which handles communication with the DMV.
- A different, dedicated .NET development team maintains Gatekeeper, so anything built has to work across both systems.
- If a validation issue is found at the Gatekeeper stage, it gets flagged and corrected.

Wrap-up / Next Steps

The session ran about two minutes over, so the remaining agenda items (CI/CD, NuGet packages, full product walkthrough) were deferred to the next meeting. Sarita Tadikamalla noted she would follow up on whether the next session continues with Pennsylvania or moves to CIS, and apologized to the Pennsylvania team for the delay caused by the prior Massachusetts session running long.
